

CogniViz™

Fast, Flexible Reporting for ARIS

Now You See It.

With ARIS, your organization is able to capture valuable information about the structure and efficiency of your business processes. And with CogniViz, you see your ARIS information in new and easily accessible ways. When you integrate CogniViz with ARIS, you maximize the visibility of your ARIS data and you maximize the return on your ARIS investment.

CogniViz is fast, flexible querying and reporting software that allows you to leverage, analyze and view your ARIS model data across multiple dimensions and in multiple formats. With CogniViz, you can unlock the data held in ARIS repositories by creating flexible queries and generating visually dynamic and interactive reports - all within minutes.

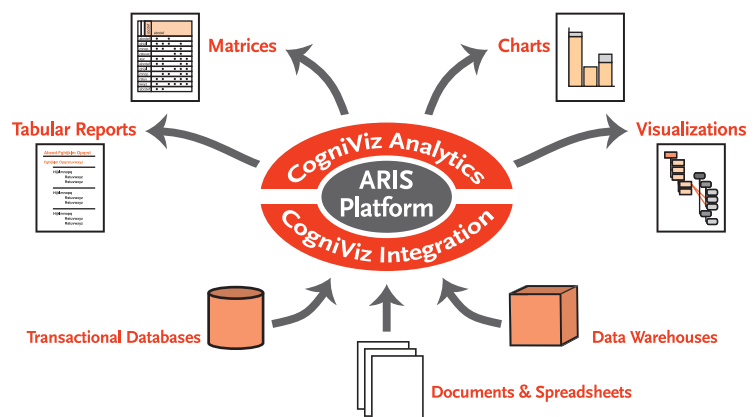

Unlock the Value of Your ARIS Data

CogniViz not only strengthens your data analysis and reporting capabilities, it also shortens the time your organization spends analyzing data and generating reports, so you become more responsive to stakeholder requests. With CogniViz, you can distribute complex information in the ways business users want to see it because the structure in which the data was captured and stored is transparent and easily accessible. The result? You improve the return on investment in your ARIS technology while continuing to benefit from ARIS's sophisticated modeling capabilities.

CogniViz Features

Our patent-pending interface enables multi-dimensional analysis across your process models within the ARIS repository. This interface is the first of its kind, combining depth and agility for superior analysis and reporting, enabling you to:

- Reuse existing objects and links stored in process models within the ARIS repository – you don't have to reinvent the wheel – or the model;
- Dynamically view your reports by drilling down into single or multiple models and the objects and links they contain;
- Instantly perform interactive data analyses – highlight and examine individual objects and links to identify and communicate their connections to the rest of the repository.

CogniViz Technology – What Makes it Unique

Our ability to generate fast, flexible queries and reports has its foundation in our patent-pending Tree & Tunnel Query™ (TTQ) interface, the heart of the CogniViz platform. TTQ is designed to query up, down and across multiple linked hierarchies of information. With TTQ, you can ask complex questions and instantly discover the relationships in your model data.

In CogniViz, querying is an intuitive process because of the innovative, graphical way TTQ represents complex hierarchical queries. As a result, you have full control over your queries, based on what you need answered.

How CogniViz Does It – the Specifics

CogniViz delivers reporting flexibility at three levels: data structure flexibility, report structure flexibility and formatting flexibility. This is accomplished through a framework that combines Queries, Report Templates and Stylesheets to provide an almost endless permutation of possible reports.

- **Queries** – Based on Cogniscape’s patent-pending TTQ interface, Queries in CogniViz combine the ease of use of Drag-and-Drop visual querying with the power of the first purpose-built multi-hierarchy querying interface.
- **Report Templates** – The complexity of ARIS data lends itself to a variety of reporting formats, from simple textual reports to advanced visualizations. Through its framework of pluggable Report Templates, CogniViz provides a broad range of standard reports as well as the capability to extend reporting through custom template development.
- **Style Sheets** – Using CSS-style syntax, CogniViz provides fine-grained formatting control over report output. CogniViz also extends this styling mechanism to support more advanced formatting functions like data-driven formatting, and integrated legends.

CogniViz Reporting – Now You See It

Our flexible framework of templates and style sheets instantly transform your querying and analysis into practical, interactive, sophisticated formats. But CogniViz goes beyond current reporting technology by enabling you – and your audience – to dynamically view and interact with your reports. Click on a single or multiple object types in your model and instantly see their relationships to other object types. Highlight a set of objects and see how they connect to the repository as a whole. You can show your audience answers to their questions quickly and in a variety of ways.

See it for Yourself

View a demo of CogniViz on our website at www.cogniscape.com, and see for yourself how CogniViz can enhance your analysis and reporting capabilities. With CogniViz, you’re able to see ARIS in a way that you never have before.

About Cogniscape

Cogniscape, a strategic analytics innovator, creates software solutions that break down information barriers to enable truly creative fact-based decision making. Through our flagship solution, CogniViz, we deliver the flexibility and power to access, analyze and distribute complex information in the ways business users want to see it, increasing corporate agility and, in turn, competitive advantage. For more information on Cogniscape and CogniViz, visit www.cogniscape.com.
